## Problem, Model and Notation

We address the problem of schedule a set of tasks in a multiprocessor environment

- ▶ tasks are sporadic
- ▶ deadline is implicit (deadline = minimum inter-arrival interval)
- ▶ a task instance has a worst case execution time (wcet)
- ▶  $R(\tau) = \text{wcet}/\text{period}$
- ▶ a task  $\tau:(4, 8)$  has  $\text{wcet} = 4$ , deadline = 8 and  $R(\tau) = 0.5$

Figure 1: Real-Time System with tasks  $\tau:(4, 8)$

# Overview of Fixed-Rate Server

$\sigma_1: (R(\sigma_1) = 0.8, \text{cli} = \{\tau_1, \tau_2\})$

$\tau_1: (2.4, 6) \Rightarrow R(\tau_1) = 0.4$

$\tau_2: (4, 10) \Rightarrow R(\tau_2) = 0.4$

Figure 19: Tasks  $\tau_1: (2.4, 6)$ ,  $\tau_2: (4, 10)$  been served by fixed-rate server  $\sigma_1: (0.8, \{\tau_1, \tau_2\})$ .

# Adaptation Strategy

## Related Work (Optimal Algorithms)

Some techniques divide time into windows and execute tasks proportionally into each window (e.g. DPW, EKG, PFair), solving theoretically this problem, but imposing a large number of preemptions.

Figure 22:  $\tau_1:(2,3)$ ,  $\tau_2:(2,3)$  and  $\tau_3:(2,3)$  executing in windows

Other (RUN, U-EDF) use different approaches with lower number of preemptions.

# Evaluation

# QPS Evaluation

- ▶ Synthetic task sets generated according to Emberson Algorithm [1];
- ▶ Sporadic and periodic systems are considered;
- ▶ QPS is compared against DPW, EKG, RUN and U-EDF
- ▶ each simulation took into consideration 1,000 task sets and run for 1,000 time units.

# Sporadic Systems

Figure 23: Average number of preemptions and migrations for systems with 16 sporadic tasks scheduled on 8 processors.

# Periodic Systems

Figure 24: Average number of preemptions and migrations for periodic systems with  $2m$  tasks that fully utilize  $m$  processors.

# Periodic Systems

Figure 25: Average number of migrations for periodic systems with  $2m$  tasks that utilize 100% and 98% of  $m$  processors.

# Conclusions

- ▶ For sporadic task systems: QPS can take advantage of late tasks in the system and execute as a partitioned approach.
- ▶ For periodic task systems: QPS has better results, when the total system utilization is not greater than 98%.
- ▶ QPS is the first algorithm which goes from partitioned to global scheduling and vice-versa as a function of system load.

Thank you!
